- **200-Word Write-Up** (Canvas text box or PDF upload).
 - This assignment was a little more difficult than previous ones with working primarily in curves. In my professional life, I use drafting programs to design 3d objects, so I have used design principles like revolve, loft, and sweep (extrude on a curve) before, but I have never used them in maya before. I decided to test out a lot of the design principles in different fashions. First, I did the vase like in the video example. I used a revolved command on that after drawing a curve. I made sure to use quads (not triangles), and then I also reversed the polygon, so that the outside mesh faced the correct direction. Making the leaf, I used loft like the video example showed. Then I practiced revolving more by making a plate. And last of all, I tested out the extrude along a path to make a hand rail. I'm very excited to use these principles to fill out my room more. I've used maya for very basic organic shape modeling for the past 10 years, and I had no idea these were options. Most of the time I just would start with a polygon primitive and move and sculpt points and pieces around. This was a nice overlap for me.
